

How to Change Your Password on Your Chromebook

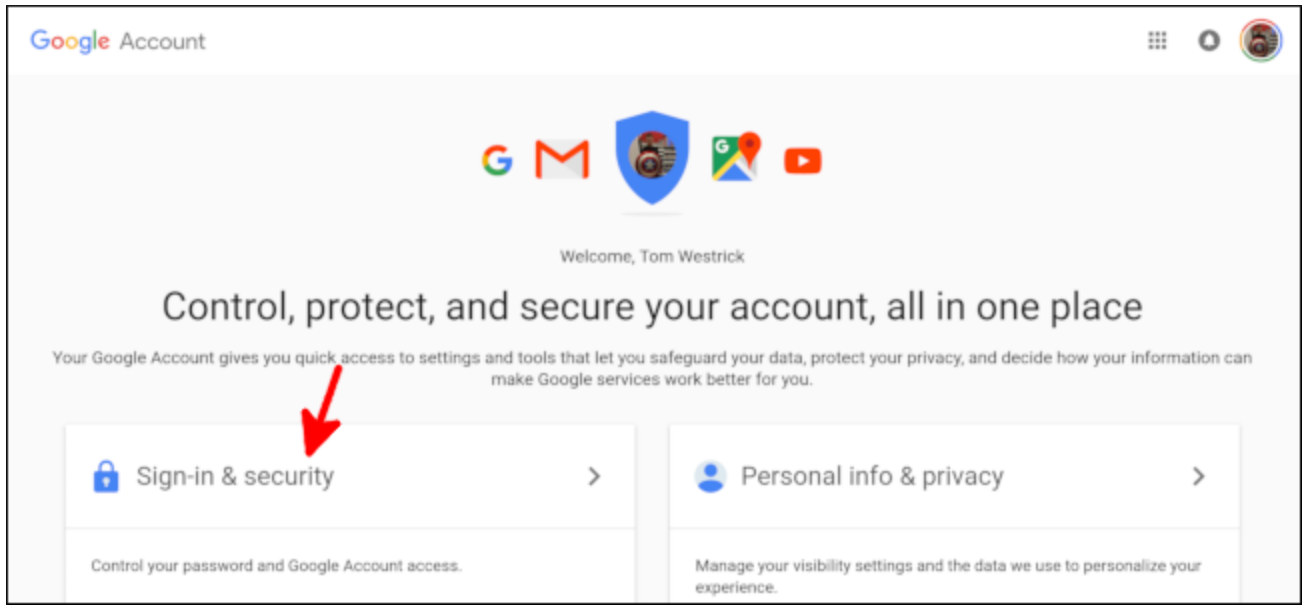

Start by opening a new Chrome browser window.

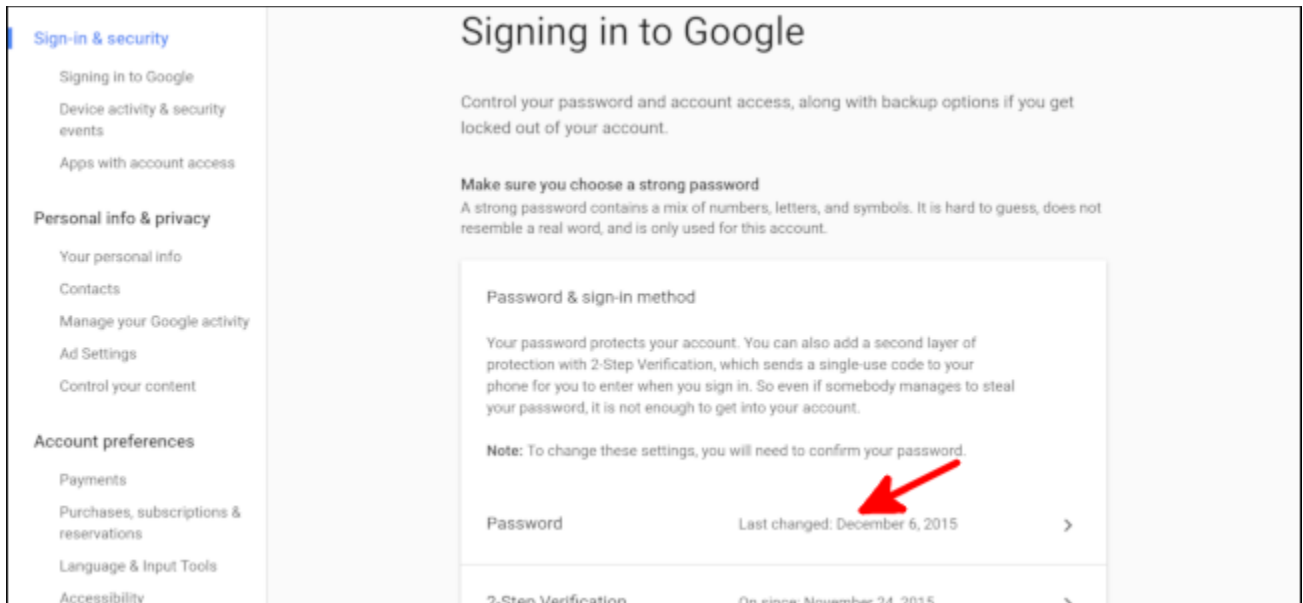

Select your profile photo in the upper-right, then select Google Account.

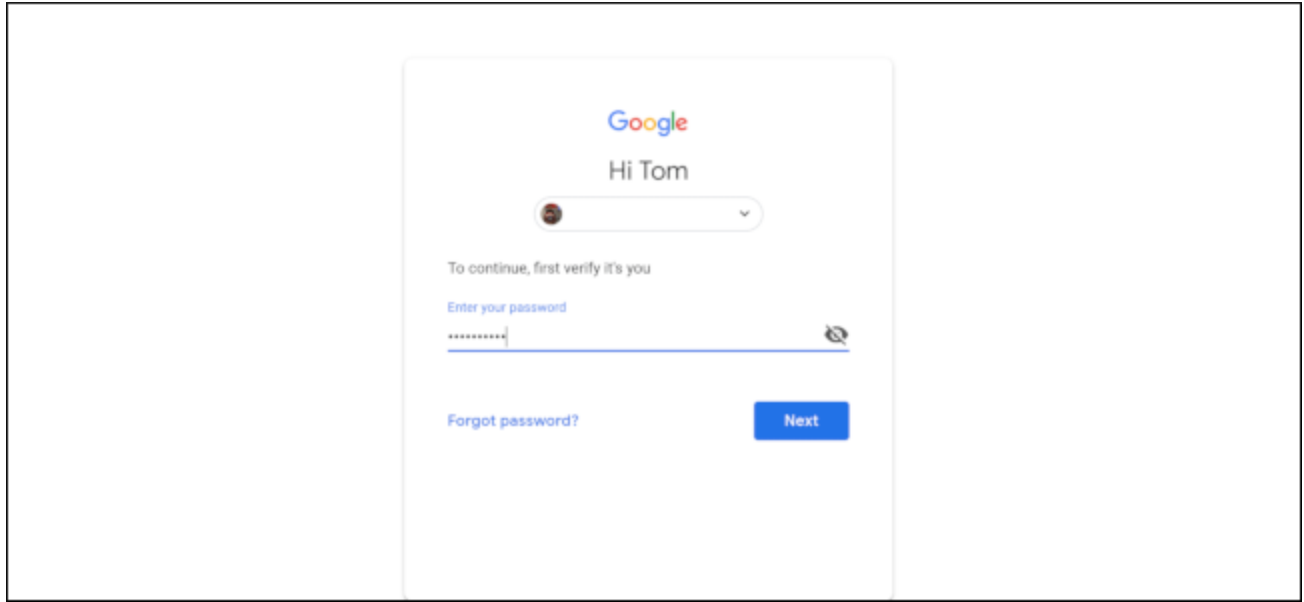

Select Sign-in & security.

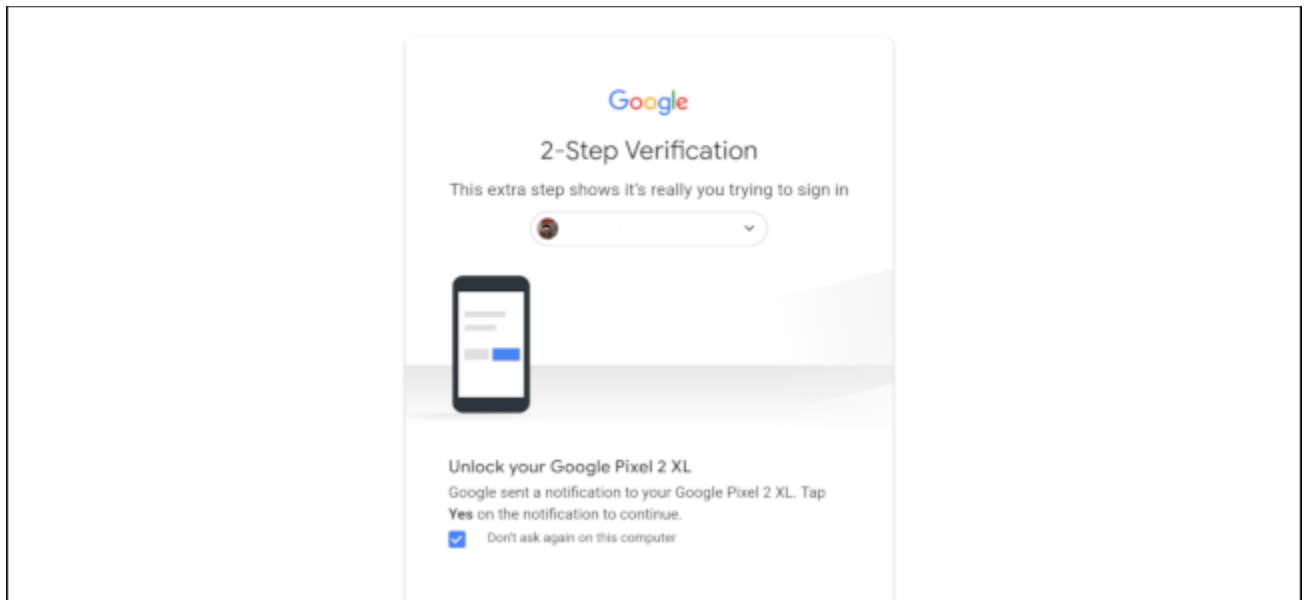

Scroll down until you see the Signing into Google section, then select "Password."

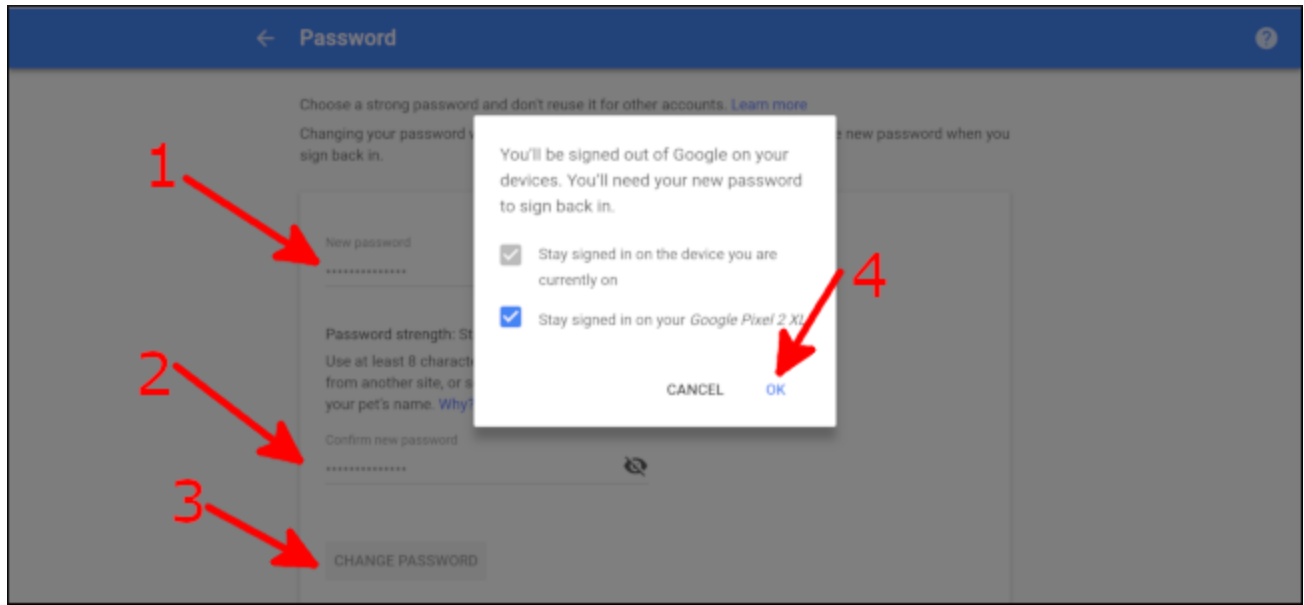

Enter your current password.

Confirm with your [two-factor authentication method](#).

Enter and confirm your new password. You'll want to [make sure the password is strong](#), or better yet, [generated by a password manager](#). Select "Change Password."

A pop-up screen lets you know that you'll be signed out of your Google account on other devices. You'll remain signed in on your current Chromebook, and if you use the Google Prompt on your smartphone as your two-factor authentication method, you can choose to remain signed into that phone as well. Select "OK."

That's it! You'll need to sign in with your new password on your other devices; then everything will work just like before!
